

SAFETY ASSESSMENT OF CHANGES

Whenever an Air Navigation Service Provider (ANSP) is planning to implement a change, it needs to be confident that safety will be ensured at all times during the transition, and also when the change is put into operation.

Skyguide has been performing safety assessments of changes since 2003. During this time, our experts have gathered significant and valuable experience in assessing complex, innovative and/or sensitive changes.

Skyguide's safety assessment framework is based on Eurocontrol's well-established Safety Assessment Methodology (SAM), which contributes to a high level of acceptance by many Civil Aviation Authorities.

During an assessment, we identify all internal/external stakeholders, impacted technical systems, relevant ATC procedures, the assessment methodology to be applied, the regulatory framework for the local Civil Aviation Authority, and also the expected time-frame of the safety assessment.
